# Self-Custody Wallet for Hurricane Relief

Designs used for a self-custody wallet app providing faster relief to hurricane victims.

# Self-Custody Wallet Design Samples

The purpose of this project was to investigate the practicality of providing relief to hurricane victims using cryptocurrency via a self-custodial wallet. My designs provided ideas on what the interface of an app serving this function could look like.

# Self-Custody Wallet Design Process

For this project, I did not have much guidance, nor did I have access to users. These designs were purely based on limited background information from the lead developer and project lead.

These designs focus on the ability to login as well as add and share user credentials with a government entity such as FEMA. FEMA would verify user credentials and add funds to their digital wallet.

After going discussing with the team on how we wanted the application to function, these designs were created. Overall, the team completed this short-term work with satisfaction.

While the app may be simple it started a truly powerful conversation on how to help people in times of need.

*More designs of this project available on request.*

## What is a digital wallet?

A digital wallet is a place to store sensitive information in digital form. This can include items such government IDs and passports. You may have heard of digital wallets in relation to financial transactions. Many institutions use digital wallets to store credit cards and other financial information.

Because such sensitive personal information is stored in online digital wallets, it is important that you take care to protect your information with a PIN. Once you have a PIN, please DO NOT share it with anyone.
